

At Washington Sea Grant, Jamie provides expertise on coastal hazard resilience, including emergency preparedness, hazard mitigation and climate change impacts for coastal communities. Incorporating holistic resilience principles into planning processes and land use policies is possible only through effective collaboration and coordination with many partners, as exemplified through Jamie's varied projects. These include:

- Washington's Coastal Hazards Resilience Network
- Incorporating resilience into planning processes for the Snohomish County Hazard Mitigation Plan Update
- Curriculum development and training for coastal managers participating in the state's Coastal Training Program's Sea Level Rise Adaptation Course
- Engaging the public in envisioning future sea level rise through the Witness King Tides Initiative
- Functioning as Washington Sea Grant's liaison to NOAA's Pacific Marine Environmental Laboratory's National Center for Tsunami Research, supporting tsunami education and outreach in coordination with other state and federal agencies.

Previously, Jamie was a Marc Hershman Marine Policy Fellow at Washington Sea Grant in 2010, where she focused on coastal hazards and coastal community resilience. She then worked on coastal hazard, climate change and hazard mitigation issues as the Hazard Mitigation Strategist at the Washington Military Department's Emergency Management Division. Jamie holds a bachelor's degree in Environmental Science and Management from Michigan State University and a Masters of Marine Affairs from the School of Marine and Environmental Affairs at the University of Washington.
